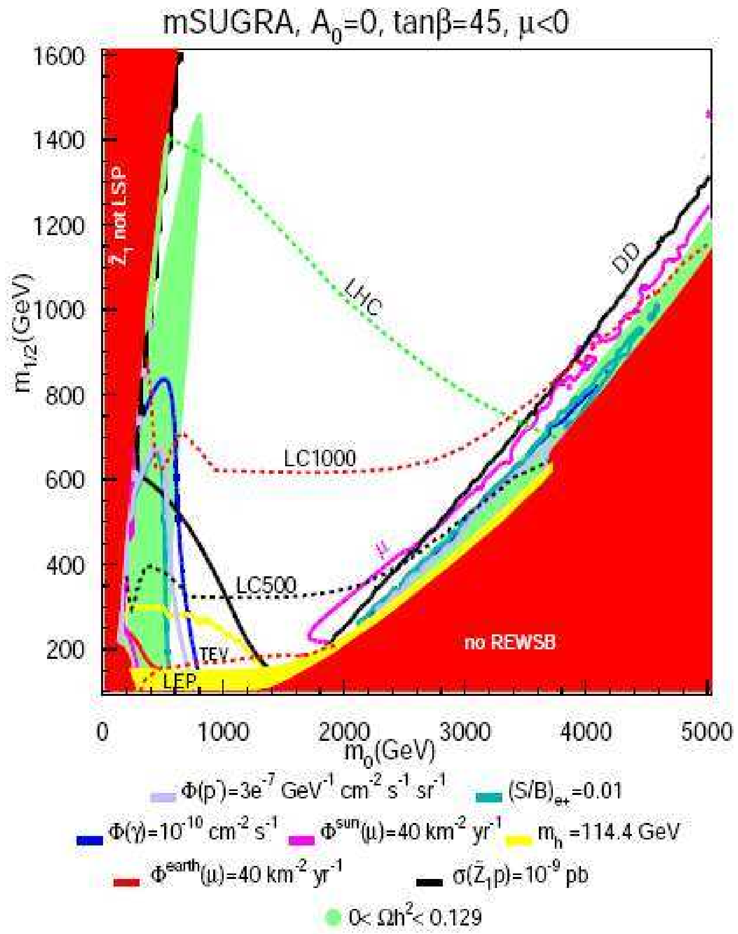
Outline

- Introduction
  - ⋆ Review of mSUGRA
  - ⋆ Motivations for SUSY models without universality in SSB terms
- Updated results on parameter space of mSUGRA
- Models with non-universal soft terms
  - ⋆ Non-universal scalar mass models
  - ⋆ Non-universal gaugino mass models
- Implications for collider searches
- Implications for direct and indirect dark matter detections
- Conclusions

Review of mSUGRA

- **Parameter space: universal SSB at $Q = M_{GUT}$**
  m_0, $m_{1/2}$, A_0, $\tan\beta$, $sign(\mu)$
- From WMAP results, $\Omega_{CDM}h^2 = 0.111^{+0.011}_{-0.015}$
  (upper bound is a tight constraint on SUSY models containing DM candidates)
- **WMAP allowed Regions in m_0-$m_{1/2}$ space**
  1. $\tilde{\tau}$ co-annihilation region at low m_0, $m_{\tilde{\tau}_1} \sim m_{\tilde{Z}_1}$
  2. bulk region at low m_0 and $m_{1/2}$, light sleptons (LEP2 excluded)
  3. Higgs-funnel H, A resonance($2m_{\tilde{Z}_1} \simeq m_{A,H}$) at large $\tan\beta \sim 50$ or h-resonance at low $m_{1/2}$ ($2m_{\tilde{Z}_1} \simeq m_h$)
  4. FP/HB region at large m_0, low $\mu \rightarrow$ mixed higgsino dark matter (**MHDM**)
  ⋆ Region 1, 2, 3 $\rightarrow$ Bino-like LSP



H.Baer et al. JCAP0408 (2004) 005

Motivations for SUSY models without universality in SSB terms

- ⋆ all relic-density-consistent regions in mSUGRA are near the edges of theoretically (or LEP2 experiment) excluded regions
- ⋆ need to examine how already drawn conclusions from the mSUGRA model are affected by relaxing the universality assumptions
- ⋆ within R-parity conserved neutralino dark matter assumption, WMAP value provides a strong constraint reducing model parameter space by one unit

We assume,

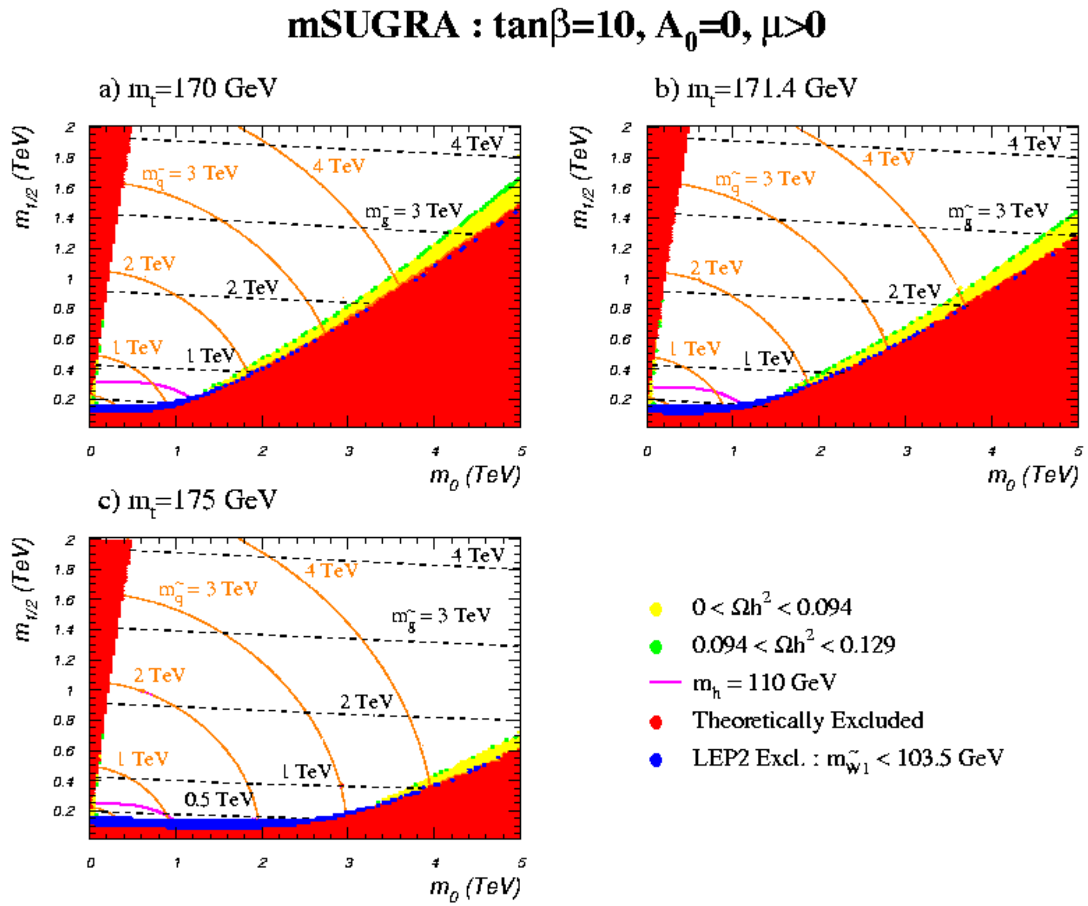
- MSSM is an effective theory between the weak and GUT scale
- R-parity is conserved
- Neutralino LSP
- (near)degeneracy of first and second generation of SSB sfermions → FCNC suppressed
- CP-violating phases in SSB suppressed → CP contribution of SUSY is small

Computational Tools are,

- all mass spectrum: ISAJET 7.76
- relic density, direct detection rates: IsaTools package (IsaReD, IsaReS)
- all indirect dark matter detection rates: DarkSUSY

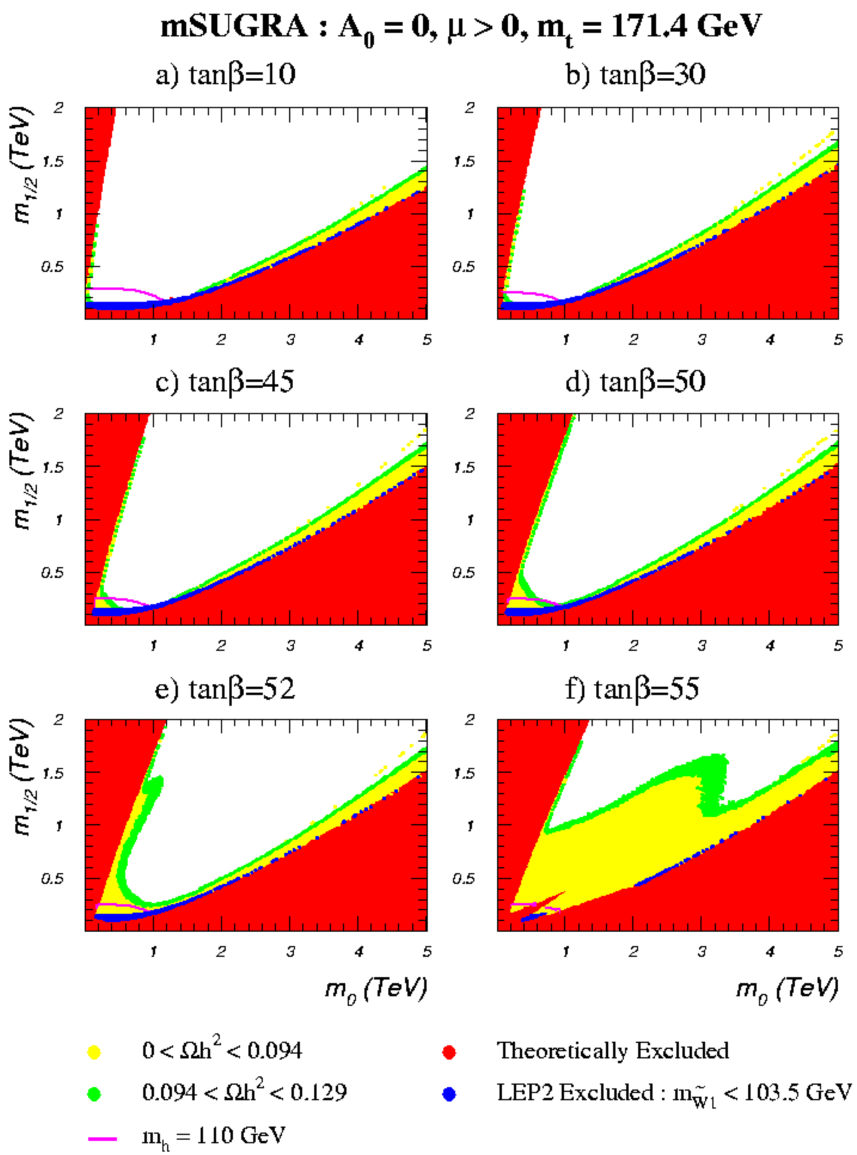
Updated results on parameter space of mSUGRA 1

- **parameter Space**
  m_0, $m_{1/2}$, A_0, $\tan\beta$, $sign(\mu)$
- **varying** m_t
  - location of EWSB excluded region
    → HB/FP region moves
  - gluino and squark mass contours hardly change
  - as m_t increased, A-funnel moves to smaller m_0



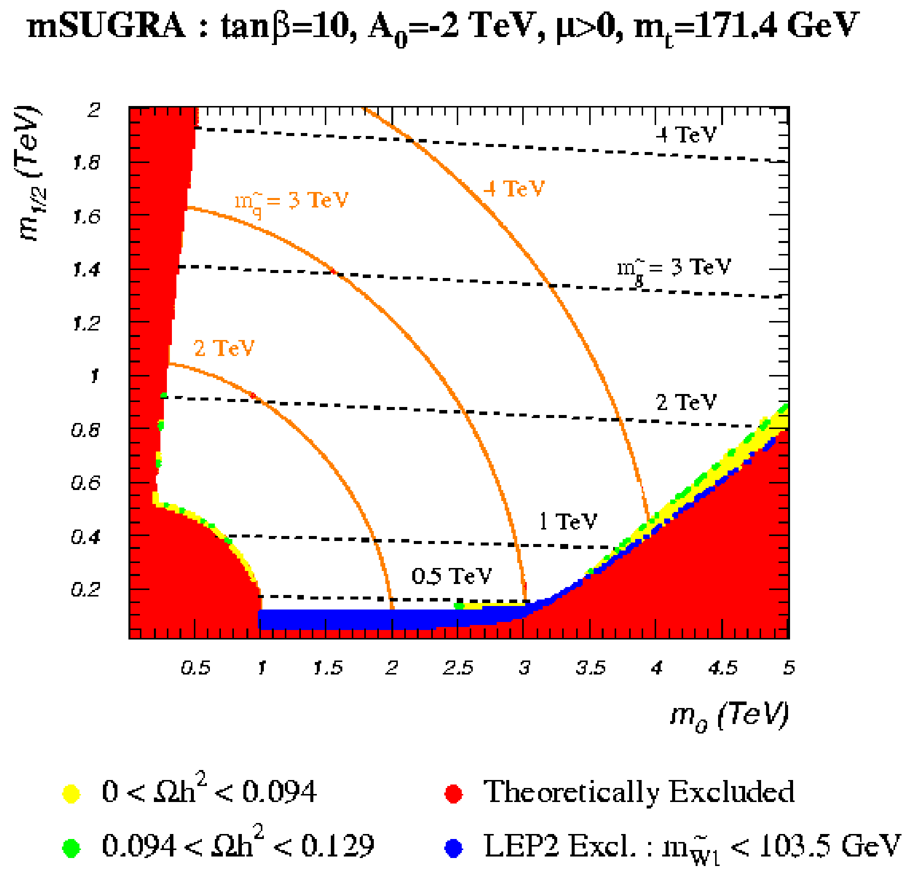
Updated results on parameter space of mSUGRA 2

- **varying tanβ**
  - larger tanβ, wider WMAP allowed region (as tanβ grows, m_A drops due to b and τ Yukawa coupling effect)
  - as tanβ increased, A-funnel moves to larger m_0
- **effect of $\mu < 0$**
  - A-funnel arises at lower tanβ
  - narrower A-funnel



Updated results on parameter space of mSUGRA 3

- **effect of large negative** A_0
  $\rightarrow$ reduce $m_{\tilde{t}_1}$
  $\rightarrow$ $\tilde{t}_1 - \tilde{Z}_1$ mass gap quite small
  $\rightarrow$ relic density reduced via stop co-annihilation



Models with non-universal soft terms

- **Relic-density-consistent models** obtained by adjusting
  - composition of neutralino (WTN: Well-Tempered Neutralino*)

    *:Arkani-Hamed et al. Nucl.Phys.B741, 108, 2006
  - masses of neutralino or other sparticles
- **Non-universal scalar mass models**
  - Generation non-universality: Normal scalar mass hierarchy (NMH)
  - Non-universal Higgs mass: one extra parameter case (NUHM1$_\mu$, NUHM1$_A$)
  - non-universal Higgs mass: two extra parameter case (HS-Higgs Splitting)
- **Non-universal gaugino mass models**
  - Mixed Wino Dark Matter (MWDM)
  - Bino-Wino Co-Annihilation Scenario (BWCA)
  - Low $|M_3|$ Dark Matter: Compressed SUSY (LM3DM)
  - High $|M_2|$ Dark Matter: left-right split SUSY (HM2DM)
- Some benchmark cases with mSUGRA parameter space

  m_0, $m_{1/2}$, A_0, tanβ, $sign(\mu)$ = 300 GeV, 300 GeV, 0, 10, +1 and $m_t = 171.4$ GeV

Non-universal scalar mass models

- generation non-universality: Normal scalar Mass Hierarchy (**NMH**)
  $m_0(1,2)$, m_0, $m_{1/2}$, A_0, $\tan\beta$, $sign(\mu)$
  - $m_0(1,2)$: first/second generation, $m_0(3) = m_{H_u} = m_{H_d} \equiv m_0$: remaining
  - dial $m_0(1,2)$ to low enough to bulk (co-)annihilation via light sleptons
- non-universal Higgs mass: one extra parameter case (**NUHM1**$_\mu$, **NUHM1**$_A$)
  m_0, δ_ϕ, $m_{1/2}$, A_0, $\tan\beta$, $sign(\mu)$
  - $m_\phi = m_0(1+\delta_\phi)$, $m_{H_u}^2 = m_{H_d}^2 \equiv sign(m_\phi)|m_\phi|^2$
  - $m_\phi > m_0$: small μ and MHDM
  - $m_\phi < 0$: $m_A \sim 2m_{\tilde{Z}_1} \rightarrow$ at any $\tan\beta$
- non-universal Higgs mass: two extra parameter case (**HS**-Higgs Splitting)
  m_0, $m_{H_u}^2$(equivalently μ), $m_{H_d}^2$(equivalently m_A), $m_{1/2}$, A_0, $\tan\beta$, $sign(\mu)$
  - $m_{H_{u,d}}^2 = m_0^2\,(1 \mp \delta_H)$
  - $\delta_H < 0$: low μ and low m_A
  - $\delta_H > 0$: WMAP region via $\tilde{l}_L/\tilde{\nu}$ or $\tilde{u}_R/\tilde{c}_R$ co-annihilation

Non-universal gaugino mass models

- Mixed Wino Dark Matter (**MWDM1**, **MWDM2**):
  m_0, M_1(or M_2), $m_{1/2}$, A_0, tanβ, $sign(\mu)$
  - by increasing the wino content of the LSP by reducing the ratio M_2/M_1
  - $M_1 \neq M_2 = M_3 = m_{1/2}$ or $M_2 \neq M_1 = M_3 = m_{1/2}$
- Bino-Wino Co-Annihilation Scenario (BWCA1, BWCA2):
  same as MWDM but M_1 and M_2 are in opposite sign
  - by allowing co-annihilation between high bino-like and wino-like states
- Low $|M_3|$ Dark Matter: Compressed SUSY (**LM3DM**):
  m_0, M_3, $m_{1/2}$, A_0, tanβ, $sign(\mu)$
  - by increasing the higgsino content of the LSP by decreasing the gluino mass
  - $M_3 \neq M_1 = M_2 = m_{1/2}$
- High $|M_2|$ Dark Matter: left-right split SUSY (**HM2DM**):
  m_0, M_2, $m_{1/2}$, A_0, tanβ, $sign(\mu)$
  - by allowing large M_2 mass
  - $M_2 >> M_1 = M_3 = m_{1/2}$

Some Benchmark Cases: non-universal gaugino mass models

parameter	mSUGRA	MWDM	BWCA	LM3DM	HM2DM
special	—	$M_1(M_{GUT})$	$M_1(M_{GUT})$	$M_3(M_{GUT})$	$M_2(M_{GUT})$

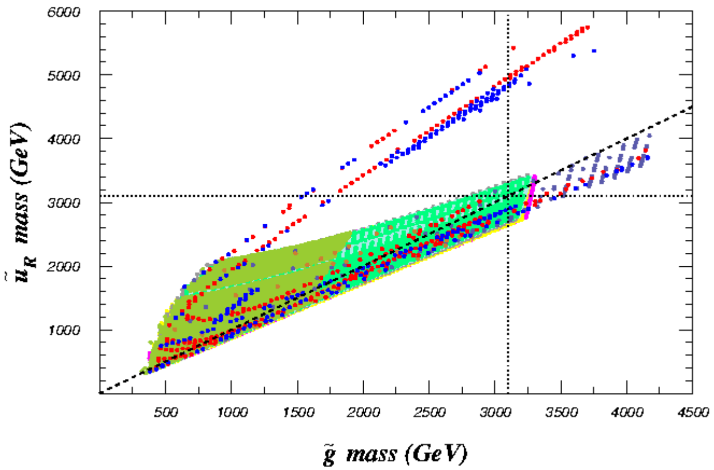
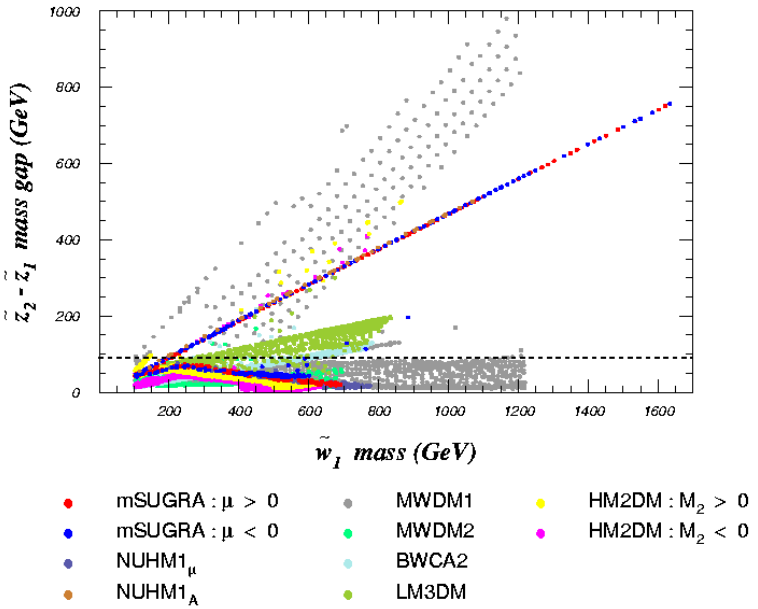
$R_{\tilde{H}}$	0.15	0.25	0.16	0.50	0.67

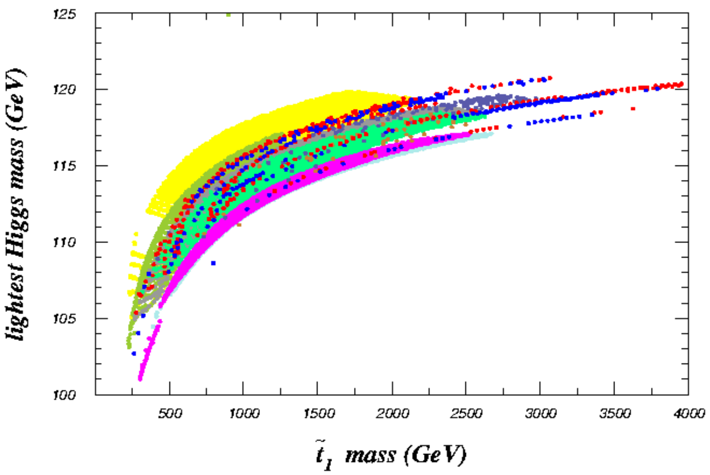
Implications for collider searches 1

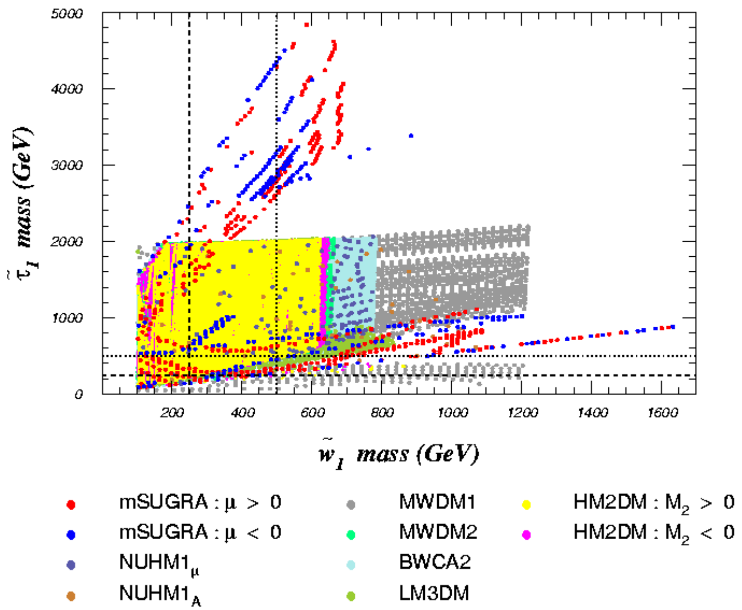




- – with $A_0 = 0$, $m_t = 171.4$ GeV, $\tan\beta = 10$ (except for the mSUGRA model: $\tan\beta = 10$, 30, 45, 50, 52 and 55)
  – non-universal mass dialed to yield $\Omega_{\widetilde{Z}_1} h^2 \simeq 0.11$
- $m_{\tilde{g}}$ *vs.* $m_{\tilde{u}_R}$
  – dotted lines: 100 fb^{-1} reach of CERN LHC
  – dashed line: $m_{\tilde{u}_R} = m_{\tilde{g}}$
  – most of models within reach of LHC except HB/FP region of mSUGRA
- $m_{\widetilde{W}_1}$ *vs.* $m_{\widetilde{Z}_2} - m_{\widetilde{Z}_1}$
  – dashed line: $m_{\widetilde{Z}_2} - m_{\widetilde{Z}_1} = M_Z$
  – below the line, 3-body decay like $\tilde{Z}_2 \to \tilde{Z}_1 l\bar{l}$ open
  – in most models, $m(l\bar{l})$ mass edge visible at LHC

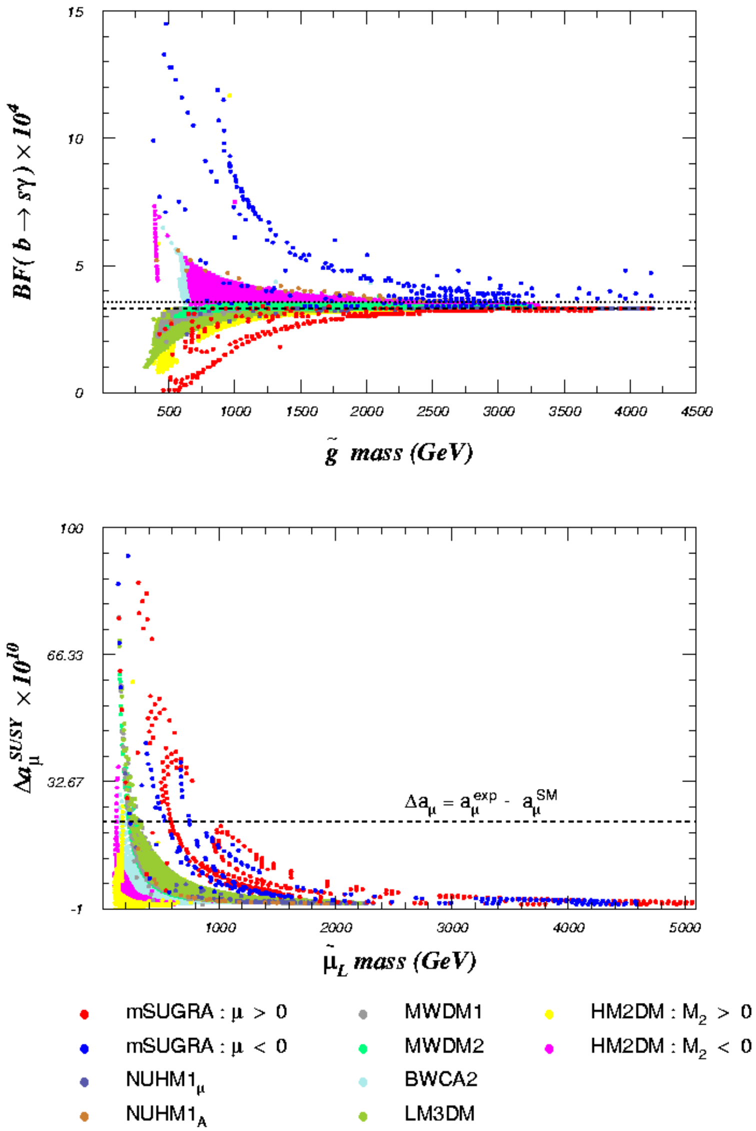
Implications for collider searches 2





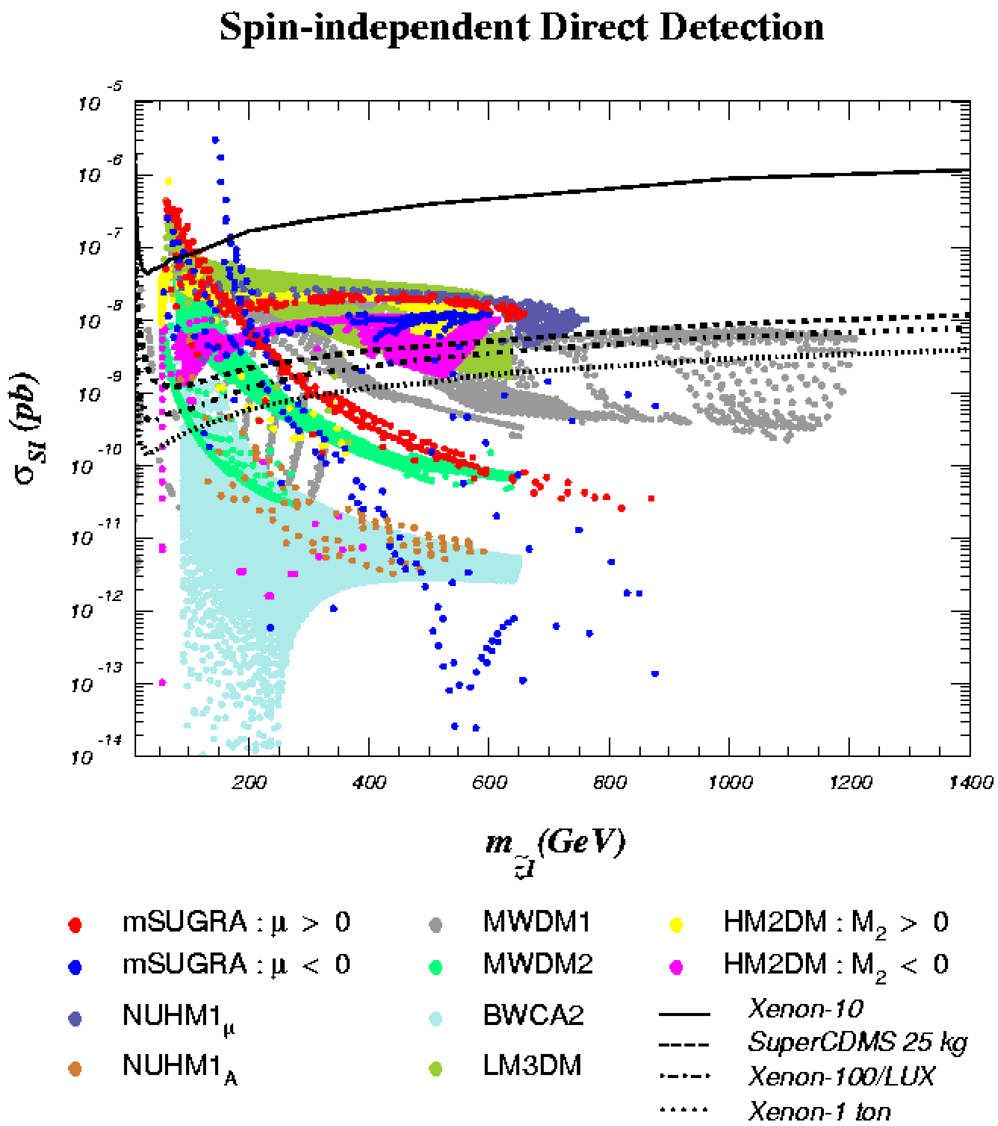
- m_h *vs.* $m_{\tilde{t}_1}$
  - heavier $\tilde{t}_1$ squarks are correlated with larger values of m_h (due to top-Yukawa radiative corrections to m_h)
  - in many models with $m_A \gg M_Z$, then $h \simeq H_{\rm SM}$: the LEP2 lower bound of 114.1 GeV applicable
- $m_{\widetilde{W}_1}$ *vs.* $m_{\tilde{\tau}_1}$
  - dashed lines: reach of ILC500 ($\sqrt{s} = 500$ GeV)
  - dotted lines: reach of ILC1000 ($\sqrt{s} = 1000$ GeV)

Implications for $BF(b \to s\gamma)$ and $(g-2)_\mu$



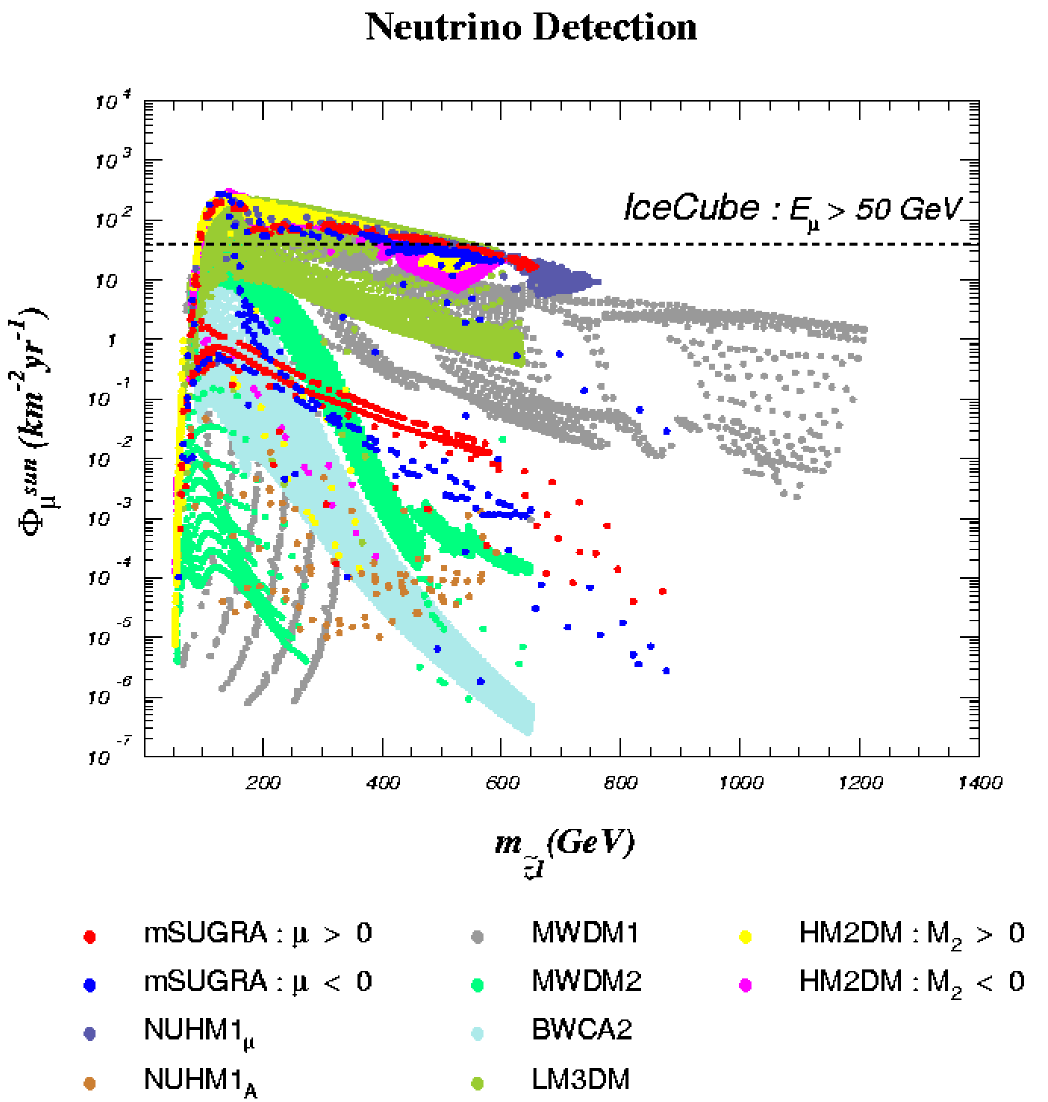
- $BF(b \to s\gamma)$
  - dotted line: combined experimental measurement (CLEO, Belle, BABAR) $BF(b \to s\gamma) = (3.55 \pm 0.26) \times 10^{-4}$
  - dashed line: SM prediction $BF(b \to s\gamma) = (3.15 \pm 0.23) \times 10^{-4}$
- $(g-2)_\mu$
  - *positive* deviation in $a_\mu \equiv \frac{(g-2)_\mu}{2}$ $\Delta a_\mu = a_\mu^{exp} - a_\mu^{SM} = 22(10) \times 10^{-10}$
  - $\Delta a_\mu^{\mathrm{SUSY}} \propto \tan\beta$

Implications for direct dark matter detection



- spin-independent neutralino-proton scattering cross section (with current and future experimental sensitivities: Xenon-10 (100, 1000), SuperCDMS, LUX)
- models with WTN within reach of next generation of detectors
- models adjusted masses to get WMAP value below sensitivities of detectors

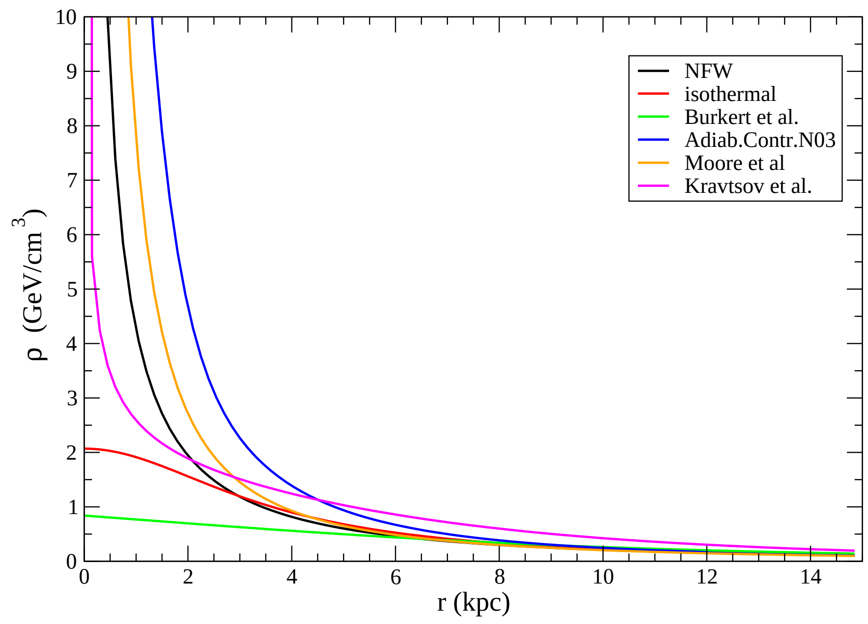
Implications for indirect DM detection - Neutrino Detection



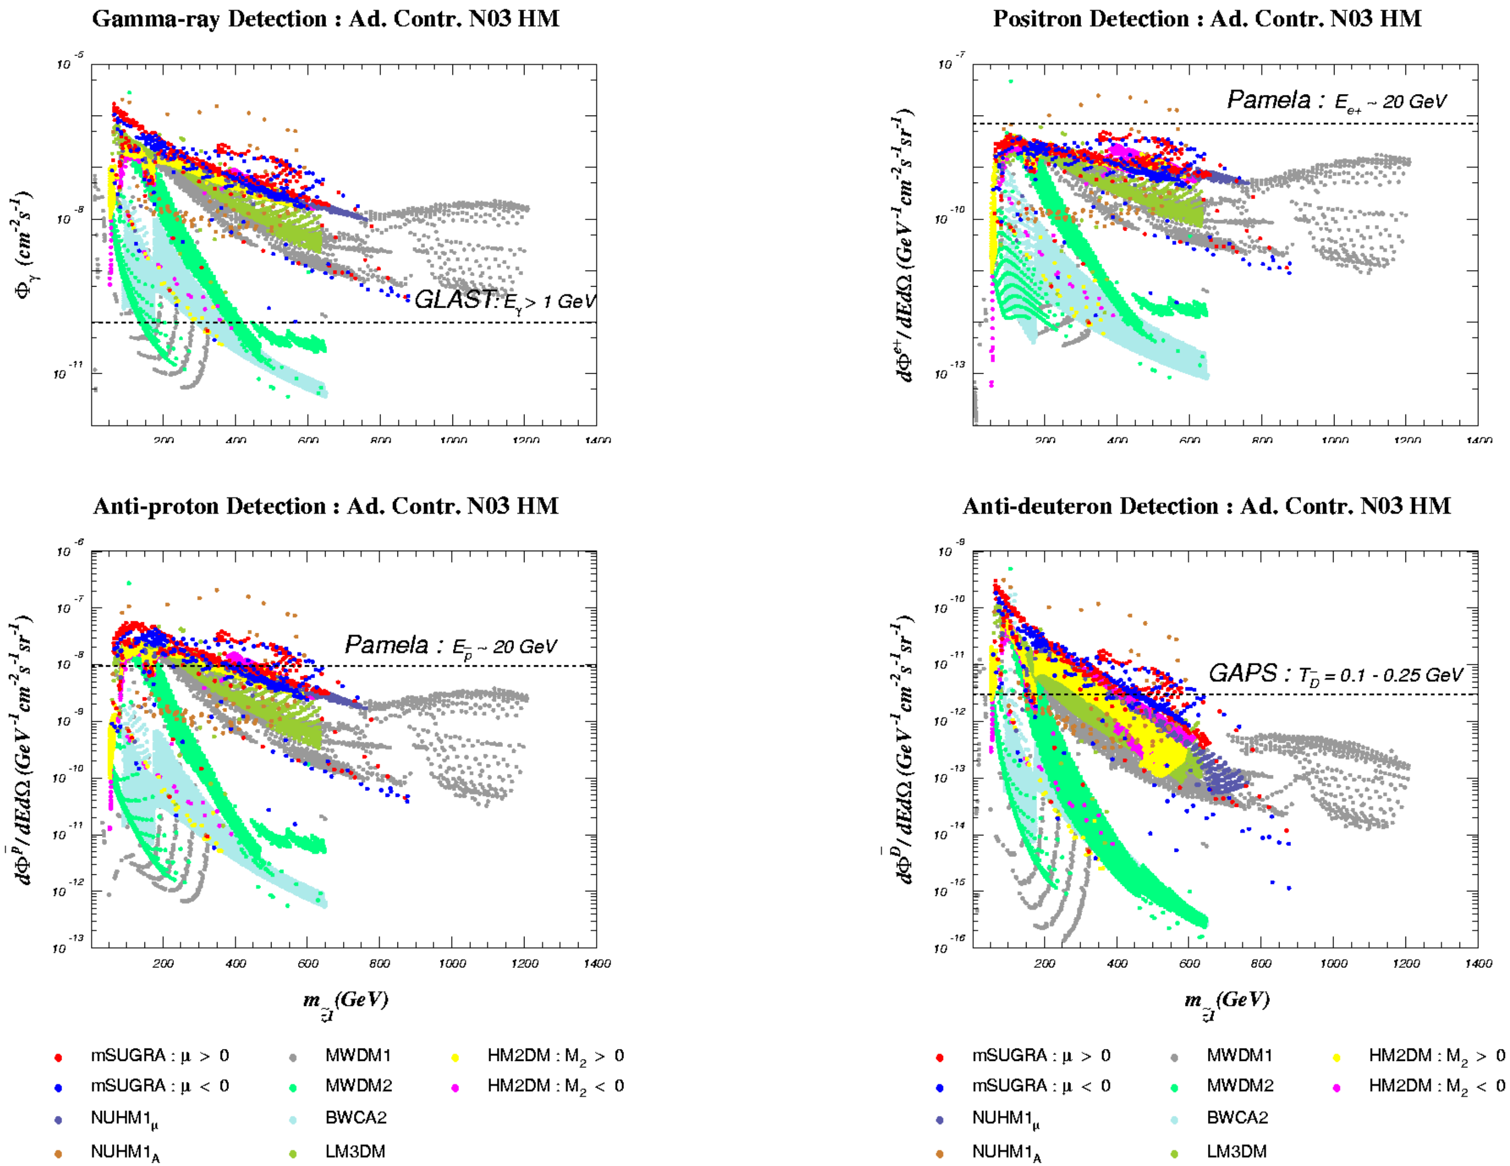
- Neutrinos from the Sun: IceCube
- muon fluxes from neutralino annihilation in the solar core to ν_μ states
- main contribution comes from Z-exchange ← enhanced if neutralino has high higgsino content

Implications for indirect(γ-ray, antiparticle) DM detection 1

- Detection of Gamma Rays from the galactic center: GLAST
- Detection of antiparticles:
  $\tilde{Z}_1\tilde{Z}_1 \to W^+W^-, q\bar{q}, ZZ, \ldots \to jets$
  Antiprotons ($jets \ni \bar{p}$) : PAMELA
  Positrons ($jets \ni e^+$) : PAMELA
  Antideuterons ($jets \ni \bar{D}$) : GAPS
- High uncertainty from Halo Density Profile



Implications for indirect(γ-ray, antiparticle) DM detection 2



Conclusions

1. ⋆ WTN occurs *only* in FP/HB region in mSUGRA (MHDM: $m_{\tilde{q}} >> m_{\tilde{Z}_1,\tilde{W}_1,\tilde{g}}$).
   But, in relic-density-consistent models, easily get WTN with $m_{\tilde{q}} \sim m_{\tilde{g}}$
   ⋆ Higgs funnel enhancement is *only* for very large $\tan\beta$ values in mSUGRA.
   But, in non-universal Higgs mass models, we have Higgs funnel for any $\tan\beta$ value
2. In many relic-density-consistent models, $\tilde{Z}_2 - \tilde{Z}_1$ mass gap $< M_Z$
   $\longrightarrow$ 2-body decay modes kinematically closed
   $\longrightarrow$ 3-body decay modes open $\Rightarrow$ at least one dilepton mass edge detectable at LHC
   $\longrightarrow$ location of dilepton mass edge is clean signature of SUSY models
3. ⋆ $m_{\tilde{q}} = m_{\tilde{g}}$, $m_{\tilde{q},\tilde{g}}$ <3100 GeV for most relic-density-consistent models
   $\longrightarrow$ implies SUSY signals at LHC
   ⋆ $m_{\tilde{\tau}}$ <500 GeV for LM3DM
   $\longrightarrow$ accessible at ILC with $\sqrt{s}$=1 TeV
4. In WTN models,
   ⋆enhanced annihilation rates enhance direct DM detection rates
   ⋆in many cases, muon neutrino signals accessible at IceCube
   ⋆indirect DM searches in galactic halo into gamma rays and anti-matter elevated; large uncertainties associated with unknown galactic DM density profile

MSSM RGEs

$$\frac{dm^2_{H_u}}{dt} = \frac{2}{16\pi^2}\left(-\frac{3}{5}g_1^2M_1^2 - 3g_2^2M_2^2 + \frac{3}{10}g_1^2S + 3f_t^2X_t\right)$$

$$\frac{dm^2_{H_d}}{dt} = \frac{2}{16\pi^2}\left(-\frac{3}{5}g_1^2M_1^2 - 3g_2^2M_2^2 - \frac{3}{10}g_1^2S + 3f_b^2X_b + f_\tau^2X_\tau\right)$$

$$\frac{dm^2_{Q_3}}{dt} = \frac{2}{16\pi^2}\left(-\frac{1}{15}g_1^2M_1^2 - 3g_2^2M_2^2 - \frac{16}{3}g_3^2M_3^2 + \frac{1}{10}g_1^2S + f_t^2X_t + f_b^2X_b\right)$$

$$\frac{dm^2_{\tilde{t}_R}}{dt} = \frac{2}{16\pi^2}\left(-\frac{16}{15}g_1^2M_1^2 - \frac{16}{3}g_3^2M_3^2 - \frac{2}{5}g_1^2S + 2f_t^2X_t\right)$$

$$\frac{dm^2_{\tilde{b}_R}}{dt} = \frac{2}{16\pi^2}\left(-\frac{4}{15}g_1^2M_1^2 - \frac{16}{3}g_3^2M_3^2 + \frac{1}{5}g_1^2S + 2f_b^2X_b\right)$$

$$\frac{dm^2_{L_3}}{dt} = \frac{2}{16\pi^2}\left(-\frac{3}{5}g_1^2M_1^2 - 3g_2^2M_2^2 - \frac{3}{10}g_1^2S + f_\tau^2X_\tau\right)$$

$$\frac{dm^2_{\tilde{\tau}_R}}{dt} = \frac{2}{16\pi^2}\left(-\frac{12}{5}g_1^2M_1^2 + \frac{3}{5}g_1^2S + 2f_\tau^2X_\tau\right)$$

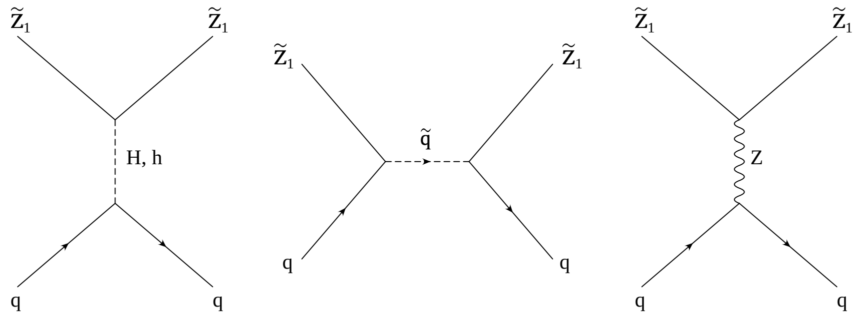
$$S = m^2_{H_u} - m^2_{H_d} + Tr\left[\mathbf{m}_Q^2 - \mathbf{m}_L^2 - 2\mathbf{m}_U^2 + \mathbf{m}_D^2 + \mathbf{m}_E^2\right]$$

where $t = \log(Q)$, $f_{t,b,\tau}$ are the t, b and τ Yukawa couplings, and

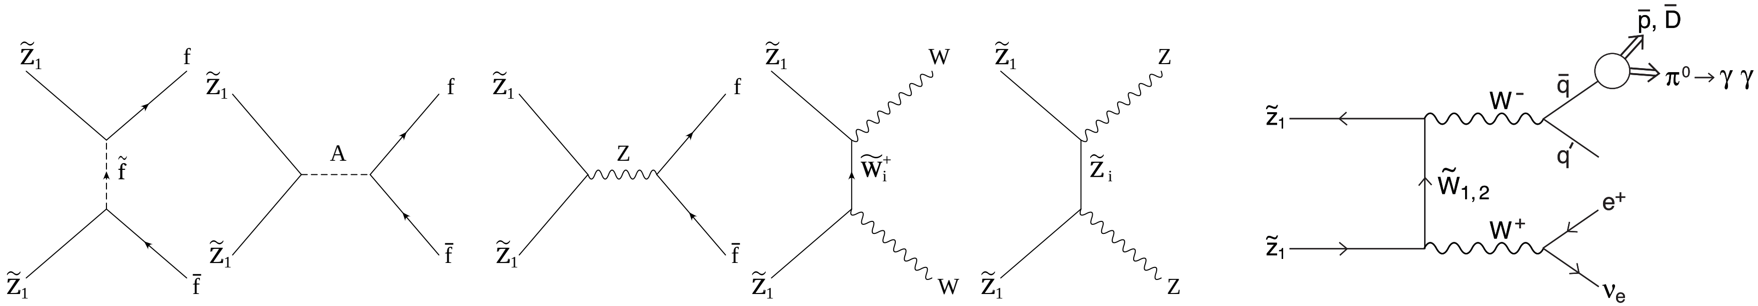
$$\begin{aligned} X_t &= m_{Q_3}^2 + m_{\tilde{t}_R}^2 + m_{H_u}^2 + A_t^2 \\ X_b &= m_{Q_3}^2 + m_{\tilde{b}_R}^2 + m_{H_d}^2 + A_b^2 \\ X_\tau &= m_{L_3}^2 + m_{\tilde{\tau}_R}^2 + m_{H_d}^2 + A_\tau^2 \end{aligned}$$

Feynman Diagrams Contributing to Neutralino DM Detection

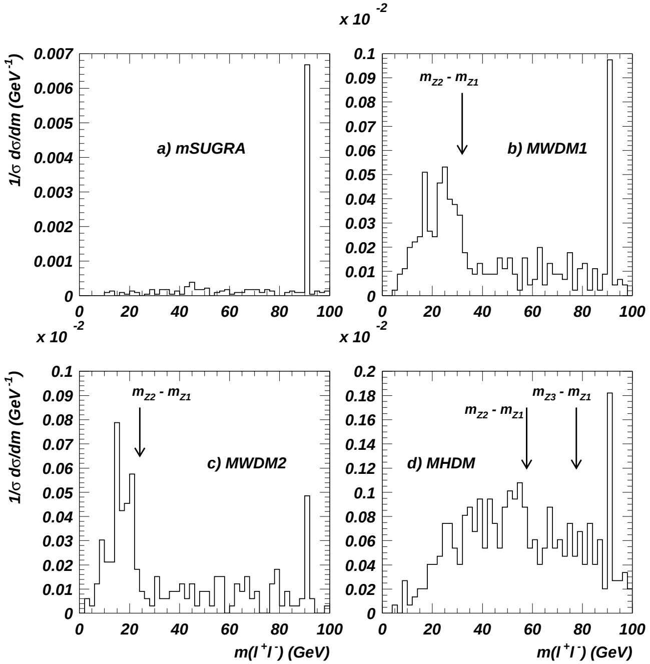
- Direct Detection

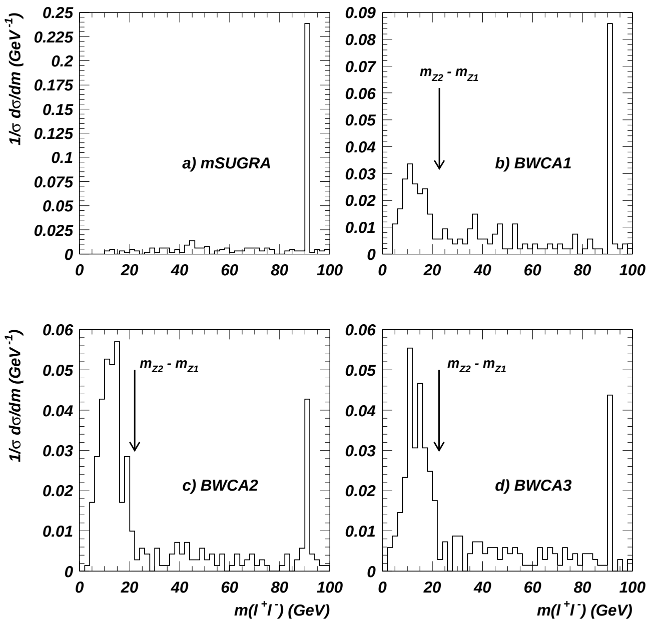


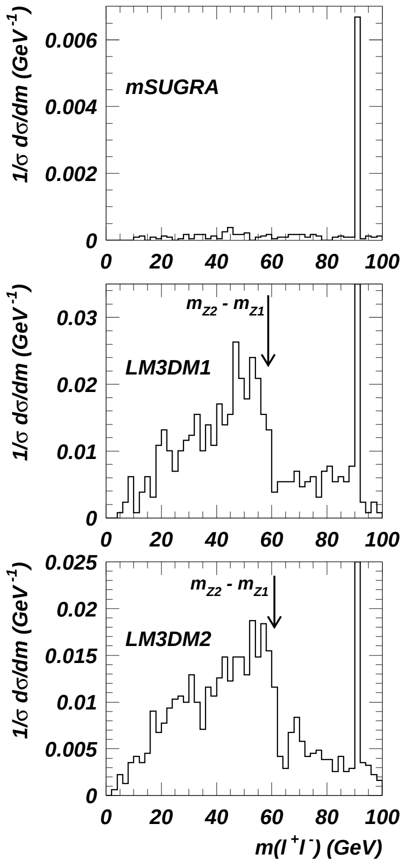
- Indirect Detection



Dilepton Distribution at LHC







- $E_T^{miss} > max(100GeV, M_{eff})$, $E_T > 50GeV$ ($n_{jet} >= 4$, hardest jet has $E_T > 100GeV$), $S_T > 0.2$, $M_{eff} > 800GeV$ LHC Point 5 from PRD 55 (1997) 5520, PRD 60 (1999) 095002
- mSUGRA : sharp peak at $m(l^+l^-) \sim M_Z$ from $\tilde{Z}_2 \longrightarrow \tilde{Z}_1 Z^0$ decays
- NUGM :
  Z^0 peak from $\tilde{Z}_3$, $\tilde{Z}_4$, $\tilde{W}_2$ decays + continuum distribution $m(l^+l^-) < m_{\tilde{Z}_2} - m_{\tilde{Z}_1}$
